1 Interview Appendix

- Interview 1, Oil and Gas Remediation Company Executive, Southwest Pennsylvania, March 9, 2021.
- Interview 2, County Commissioner, Southwest Pennsylvania, May 27, 2021.
- Interview 5, County Commissioner, Southwest Pennsylvania, June 14, 2021.
- Interview 4, County Commissioner, Southwest Pennsylvania, June 16, 2021.
- Interview 5, State Representative, Pennsylvania, June 17, 2021.
- Interview 6, Local Economic Development Official, Southwest Pennsylvania, May 27, 2021.
- Interview 7, Township Secretary, Southwest Pennsylvania, May 27, 2021.
- Interview 8, Transition Grants Manager, Non-Governmental Organization, June 10, 2021.
- Interview 9, State Senator, Pennsylvania, June 4, 2021.
- Interview 10, Chamber of Commerce Director, Southwest Pennsylvania, June 8, 2021.
- Interview 11, Coal Miner, Southwest Pennsylvania, August 9, 2021.
- Interview 12, Resident, Southwest Pennsylvania, August 9, 2021.
- Interview 13, Union Representative, Southwest Pennsylvania, June 10, 2021.
- Interview 14, County Commissioner, June 16, 2021.
- Interview 15, Transition Planner, Non-Governmental Organization, June 16, 2021.
- Interview 16, County Commissioner, Southwest Pennsylvania, August 18, 2021.
- Interview 17, County Commissioner, Southwest Pennsylvania, July 20, 2021.
- Interview 18, County Land Use Planner, Southwest Pennsylvania, July 21, 2021.
- Interview 19, Planning Administrator, Southwest Pennsylvania, July 21, 2021.
- Interview 20, Career Center Instructor, Southwest Pennsylvania, July 21, 2021.
- Interview 21, Resident and Environmental Activist, Southwest Pennsylvania, July 21, 2021.
- Interview 22, Township Manager, Southwest Pennsylvania, July 21, 2021.
- Interview 23, Community Organizer, Southwest Pennsylvania, July 22, 2021.

- Interview 24, Resident, Southwest Pennsylvania, July 22, 2021.
- Interview 25, Resident, Southwest Pennsylvania, July 22, 2021.
- Interview 26, Resident, Southwest Pennsylvania, July 22, 2021.
- Interview 27, Gas Industry Worker, Southwest Pennsylvania, July 22, 2021.
- Interview 28, Gas Industry Worker, Southwest Pennsylvania, July 22, 2021.
- Interview 29, Coal Miner, Southwest Pennsylvania, July 23, 2021.
- Interview 30, Gas Industry Worker, Southwest Pennsylvania, July 23, 2021.
- Interview 31, Resident, Southwest Pennsylvania, July 22, 2021.
- Interview 32, Gas Industry Worker, Southwest Pennsylvania, July 23, 2021.
- Interview 33, Coal Miner, Southwest Pennsylvania, July 23, 2021.
- Interview 344, Community Organizer, Southwest Pennsylvania, July 23, 2021.
- Interview 35, County Economic Planning Official, Southwest Pennsylvania, July 28, 2021.
- Interview 36, Former Coal/Gas Company Owner, Southwest Pennsylvania, August 9, 2021.
- Interview 37, Resident, Southwest Pennsylvania, August 9, 2021.
- Interview 38, Environmental Researcher, Southwest Pennsylvania, August 5, 2021.
- Interview 39, County Economic Planning Official, Southwest Pennsylvania, July 28, 2021.
- Interview 40, County Economic Planning Official, Southwest Pennsylvania, July 23, 201.
- Interview 41, Gas Industry Worker, Southwest Pennsylvania, August 7, 2021.
- Interview 42, Local Political Organizer, Southwest Pennsylvania, August 8, 2021.
- Interview 43, Non-Profit Director, Southwest Pennsylvania, August 8, 2021.
- Interview 44, Coal Miner, Southwest Pennsylvania, August 10, 2021.
- Interview 45, Coal Miner, Southwest Pennsylvania, August 10, 2021.
- Interview 46, Labor Union Official, Minnesota, April 19, 2022.
- Interview 47, Labor Union Official, Minnesota, April 19, 20212.
- Interview 48, Resident, Jeongseon, South Korea, June 14, 2022.

- Interview 49, Labor Union Official, Minnesota, July 6, 2022.
- Interview 50, Labor Union Official, Minnesota, July 6, 2022.
- Interview 51, Oil/Gas Industry Researcher, Texas, July 12, 2022.
- Interview 52, Senior Federal Lobbyist, Electric Power Company, July 28, 2022.
- Interview 53, Senior Director, Electric Power Company, July 28, 2022.
- Interview 54, Transition Planner, Non-Governmental Organization, Southwest Pennsylvania, August 4, 2022.
- Interview 55, Labor Economist, August 5, 2022.
- Interview 56, Coal Miner, Southwest Pennsylvania, August 7, 2022.
- Interview 57, Resident, Southwest Pennsylvania, August 8, 2022.
- Interview 58, Federal Economic Development Official, August 9, 2022.
- Interview 59, School District Superintendent, Southwest Pennsylvania, August 11, 2022.
- Interview 60, School District Superintendent, Southwest Pennsylvania, August 11, 2022.
- Interview 61, School District Superintendent, Southwest Pennsylvania, August 11, 2022.
- Interview 62, School District Superintendent, Southwest Pennsylvania, August 11, 2022.
- Interview 63, Solar Energy Instructor, North Carolina, August 16, 2022.
- Interview 64, Senior Public Utilities Commission Official, Minnesota, August 17, 2022.
- Interview 65, Tracy Bertram, Mayor of the City of Becker, Minnesota, August 30, 2022.
- Interview 66, Greg Lerud, City Administrator of the City of Becker, Minnesota, August 30, 2022.
- Interview 67, Senior Manager, Wind Energy Developer, August 30, 2022.
- Interview 68, Senior Federal Lobbyist, Electric Power Company, August 31, 2022.
- Interview 69, Senior Federal Lobbyist, Electric Power Company, August 31, 2022.
- Interview 70, Communications Official, Electric Power Company, August 31, 2022.
- Interview 71, Senior Sustainability Official, Electric Power Company, August 31, 2022.

- Interview 72, Wind Turbine Technician, West Virginia, September 9, 2022.
- Interview 73, Michael Oppenheimer, former President of the Environmental Defense Fund, September 20, 2022.
- Interview 74, Senior Official of Renewable Energy Trade Association, September 21, 2022.
- Interview 75, County Commissioner, Wyoming, September 22, 2022.
- Interview 76, Senior Public Utilities Commission Official, Minnesota, September 28, 2022.
- Interview 77, Senior Federal Lobbyist, Electric Power Company, October 11, 2022.
- Interview 78, Executive, Electric Power Company, November 8, 2022.
- Interview 79, Kris Mitchell, Director of the Boone County WV Development Corporation, West Virginia, November 10, 2022.
- Interview 80, Payton May, Chief Operating Officer of Bit Source and former coal industry worker, November 15, 2022.
- Interview 81, Rusty Justice, founder of Bit Source and former coal engineer, November 15, 2022.
- Interview 82, Neil Chatterjee, former Chairman of the Federal Energy Regulatory Commission, November 23, 2022.
- Interview 83, Senior Official at International Oil Major, November 29, 2022.

2 Samples

Table 1: Overview of populations and samples

Population	Partner	N	Date
National	Qualtrics	1,159	12/2021–4/2022

2.1 Qualtrics

2.1.1 Quotas

National samples. The Qualtrics samples employed quotas for gender, age, education, race, and Hispanic ethnicity, set at proportions from the Census to ensure national representativeness. In one national survey (12/2021–4/2022), Qualtrics erroneously flipped the quota for education, which yielded a higher educated sample than intended. To address this imbalance, we randomly removed a set of these college-educated individuals to achieve the proper quota and produce a final sample of 1,159 respondents. Fortunately, we had simultaneous surveys in the field that asked the same questions as this particular nationally representative sample, so the inferential impact of this administrative error was minimal.

Youth sample. For the national youth sample, we used quotas for gender, age, race, and Hispanic based on Census proportions but do not include a quota for 4-year college education, which is more heterogeneous in the youth population, some of whom are still

students but plan to pursue a bachelor’s degree. The quotas were the same across blocks due to the minimal benefit of adding cost and complexity with quotas based on the joint distribution of age within each quota category.

Regional samples. The regional sample used nationally representative quotas for gender, age, race, and education. For each region, there was a target for around one-third to be from urban ZIP codes and two-thirds from non-urban ZIP codes. The book describes how some of the ethnicity quotas had to be relaxed for regional samples.

2.1.2 Quality Checks

We employed standard quality checks: screening respondents who failed instructional manipulation checks, those who completed the survey faster than two-thirds of the median completion time, and those who failed embedded meta-data timer checks.

2.2 County Fair

The county fair surveys employ convenience samples. To enhance their representativeness, we use population data from the 2018 5-year American Community Survey to construct the weights. Specifically, we use the joint distribution of age, education and sex; the joint distribution of age, race, and sex; and the distribution of income to estimate weights with raking. Gazmararian (2022, 2023) contain additional details.

2.3 Local Policymakers

We collaborated with CivicPulse to field the survey of local policymakers. CivicPulse works with scholars to survey local political leaders across the United States. CivicPulse handles the identification of local officials, survey fielding, anonymization when needed, and project management.¹ We used a survey firm rather than contacting local officials ourselves to protect the common pool resource of public officials who are willing to cooperate with researchers. CivicPulse is a nonprofit organization that partners with academics to conduct surveys of local governments. The organization’s aim is to generate knowledge that is useful for both scholars and local officials.

Of people in local government, our survey targets policymakers, defined as individuals that are top elected officials or governing board members of their respective level of government. These individuals set the policy agenda and are often directly accountable to voters via elections. CivicPulse creates its sampling frame using the publicly available contact information for government officials at the state and local levels. The national sampling frame covers all townships, municipalities, and counties in the United States with a population exceeding 1,000. Within this frame, we targeted two populations: first, a nationally representative sample (“National”); and second, non-metro areas of top fossil fuel producing states (“Energy Communities”). From the nationally representative sample, we aimed to reach 400 respondents.

¹Visit <https://www.civimpulse.org> for additional background.

For the Energy Communities sample, we designed a custom frame of counties that are of theoretical and practical relevance. First, this sample includes counties in the top fossil fuel-producing states because these are the places that will incur direct costs from decarbonization and thus are often opponents of climate policy. Second, of counties in the top oil, gas, and coal states, the frame focuses on non-metro areas because such regions tend to have the highest reliance on extractive industries (e.g., Campbell in Wyoming), whereas metro areas have more diversified economies (e.g., Harris County in Texas, home to Houston). We expend considerable resources to over-sample from these areas because these rural fossil fuel-producing locations are otherwise under-represented in national surveys. The target number of responses from this sample was 200.

To determine the top fossil fuel-producing states, we began by classifying counties according to their share of oil, gas, and coal employment relative to the national average. Data came from the Quarterly Census of Employment and Wages (QCEW).² We used annual figures compiled in 2020. Fossil fuel industries are identified by their North American Industry Classification System (NAICS) codes: 2121 for coal mining and 2111, 213112, and 213111 for oil and gas. Any county with a location quotient greater than one for either the oil and gas or coal industries qualifies as a fossil fuel county for the purposes of determining states with the most fossil fuel counties. The location quotient is a statistic that compares the concentration of an industry within a specific area to the concentration of that industry nationwide. If a location quotient equals one, then the industry has the same share of its area employment as it does in the nation. A location quotient greater than one indicates that an industry has a larger share of the local area employment than is the case nationwide.³ Then, we created a subset of all states with five or more fossil fuel counties.⁴

Next, in these top fossil fuel-producing states, we narrowed the data to all non-metro counties. To be expansive, this included some counties that might not have a particularly high share of employment in the fossil fuel industry. Although, there are theoretical reasons to include these counties: they may be adjacent to areas where the industry is strong; workers may commute across counties; and local politicians may perceive a regional economic interest in the fossil fuel industry. Employing this more expansive sample is also necessary to balance cost considerations. To determine which counties are non-metro, we used the 2013 Rural-Urban Continuum Codes from the U.S. Department of Agriculture.⁵ These codes divide counties into three metro and six non-metro categories, with their metropolitan status being determined by commuting distance criteria from the 2010 Census and 2006-10 American Community Survey as prescribed by the Office of Management and Budget.

Each sample – National and Energy Communities – is a random sample of the officials within the frames. Recruitment occurs via invitations sent over email. According to CivicPulse, the first-time response rate is 7-8 percent. Of the officials who respond, over 80

²<https://www.bls.gov/cew/>

³We compare the location quotient with a measure of the proportion of county fossil fuel employment and unsurprisingly find a strong correlation: $r = 0.39$.

⁴We also added Alaska, despite having fewer than 5 fossil fuel counties, due to the relative importance of the oil industry. Other states included in the sampling frame are as follows: Colorado, Illinois, Kansas, Kentucky, Louisiana, Montana, North Dakota, Ohio, Oklahoma, Pennsylvania, Texas, Utah, West Virginia, and Wyoming.

⁵<https://www.ers.usda.gov/data-products/rural-urban-continuum-codes/>

percent continue to participate in future surveys. Thus, the local officials taking the survey represent a mix of first-time respondents and people with survey-taking experience. The surveys were administered online using the Qualtrics platform. All survey responses were de-identified to maintain confidentiality. Participants do not receive compensation.

2.4 Sample Descriptions

3 Chapter 1

3.1 Industry List for Map

The following NAICS Codes capture fossil fuel industries: 213111, 213112, 211120, 211130, 237120, 486110, 486210, 486910, 424710, 424720, 324110, 324121, 324122, 324191, 324199, 212114, 212115, 213113, 212111, 212112, 212113, 221112. The following NAICS Codes capture internal combustion engine manufacturing: 336310, 336350, 336320, 336390.

4 Chapter 3

4.1 Commitment to Local Economic Development

Table 17 corresponds with the analysis on pp. 81-83.

Table 17: Linear regression of perceptions of government commitment to local economic development

	National	Youth	Policymaker	County Fair

4.5 IRA Support

Table 23 corresponds with the analysis of the following question on pp. 85-87.

The federal government just passed a law that will make investments in renewable energy like solar and wind. Over the next 10 years, how likely do you think it is that the following groups would try to reverse the law, remain neutral, or continue to support the law? *Very likely to reverse; Somewhat likely to reverse; Likely to remain neutral; Somewhat likely to support; Very likely to support*

The groups included Republicans, Democrats, Fossil fuel companies, Renewable energy companies.

5 Chapter 4

5.1 Regional Differences

The materials in this appendix correspond with pp. 101-106. We examine regional differences in beliefs about local economic opportunity using linear regressions that include a battery of individual and regional covariates. The main outcome is the respondent's answer to the future or local jobs question, which we scale along a linear scale from 0 to 1, where higher values indicate more optimistic beliefs. We focus on solar and wind jobs, since these are core renewable energy industries. The control variables include partisan identification; climate change concern; age; college education; employment status; income; whether one works in the coal, oil or gas industries; and indicators for Black and Hispanic. To examine differences across the country, we include a categorical variable for each regional sample. We separate the regional samples based on whether the respondents are in urban or non-urban areas because we calibrated our recruitment strategy to reach rural areas where the economic effects of climate transitions are most acute. The national sample serves as the reference category.

The first model includes measures for individual political and socio-economic characteristics and our sample indicators. The second model adds our measure for concern about global warming. The third model adds controls for local levels of renewable energy generation and level fossil fuel production employment. Renewable energy generation data is drawn from the US Energy Information Agency (EIA). Fossil fuel production employment comes from the County Business Patterns data. We also explored using other estimates of renewable energy with data from Gard-Murray (2022). The fourth model takes the sum of the responses to the healthcare, computer programming, and trucking industries for each outcome variable and then scales them from 0 to 1. This allows us to control for the overall disposition of an individual toward economic opportunity.

5.3 Fairgoer Beliefs About Durability of Green Jobs

Table 36 corresponds with analysis on pp. 105-109. The politician treatment corresponds with the randomized text inside braces.

Some {politicians/power companies} say the growth of renewable energy like wind and solar will create new well-paying jobs. If these jobs come to your community, for how long do you think they would last? *Very long; Somewhat long; Not very long; Not long at all.*

6 Chapter 5

6.1 Multi-Attribute Policy Experiment

Estimation We estimate the ACME using linear regression with robust standard errors clustered by respondent. We employ an “uniform” AMCE since the profiles are of policies, not candidates, so there does not exist a relevant distribution of real world profiles (de la Cuesta, Egami, and Imai, 2022).

Data Quality Given the nuances of these policy dimensions, we take five steps to ensure respondent comprehension. First, we provide extensive and clear instructions to explain the attributes and tasks. Second, we employ both content and metadata-based attention checks to ensure that subjects understood the instructions and read with care. Third, we limit the number of attributes and tasks to five each, well within the guidance of Bansak et al. (2018), who find that respondents still pay attention and provide quality answers even when designs include up to 30 tasks. Fourth, we optimized the conjoint table to fit mobile screens so respondents could simultaneously view much of the table and answer options. Lastly, we include a slew of interpretation checks after the conjoint tasks.

6.1.1 Interpretation Checks

Reversibility Table 43 reports the results from a regression estimating the effect of institutional constraints on expectations of policy reversibility. The question corresponds with the following survey item:

Suppose the government establishes tax credits that are supposed to last for 15 years. By law, the tax credits are {not reversible/reversible by the {President / Governor / lawmakers}}. How many years do you think the tax credits will last?
(Responses range from 0 to 15.)

Costly Signals

If in addition to the tax credits, the government also {guaranteed \$15 million for county schools/gave counties the ability to apply for \$20 million for county schools (75 percent receive funds). How committed or uncommitted would you say the government is to creating jobs in the county?

Very committed; Somewhat committed; Somewhat uncommitted; Very uncommitted.

The most frequent response in both treatment conditions is that the government is “somewhat committed,” so to capture more variation, we analyze an indicator variable for if the government is seen as very committed or not.

We estimate a linear regression of the outcome on the treatment and a set of covariates. We include covariates for gender, race, ethnicity, and 4-year college degree, political party, and rurality. Employment and income have no predictive value, so we trim those covariates for parsimony. We include age as well as a quadratic term since we observe a non-linear relationship in the effect of age.

Table 46 reports the results of estimating the effect of the costly signals treatment on beliefs about the government’s commitment to local economic development. Model (5) contains the most relevant result, which shows how there is a positive effect of the treatment for Republicans and Independents, but not for Democrats.

6.1.2 Heterogeneous Effects by Partisanship

Figure 1: Heterogeneous effects by partisan identification for the multi-attribute policy experiment. Thick and thin bars denote 90 and 95 percent confidence intervals. Standard errors clustered at the respondent level.

6.2 Can Benefits Lock In Support?

6.2.1 Survey Instrument

The treatment vignette read:

{(Display no text in the first condition.) /

Imagine that because of these tax credits, there will be a new electric vehicle manufacturing plant that opens in your area and creates well-paid jobs. If the federal government ended its incentives for consumers to buy electric vehicles, the manufacturing plant would have to close. /

Imagine that because of these tax credits, there will be a new electric vehicle manufacturing plant that opens in your area and creates well-paid jobs. If the federal government ended its incentives for consumers to buy electric vehicles, the manufacturing plant would have the ability to produce different products. /

Imagine that because of these tax credits, there will be a new electric vehicle manufacturing plant that opens in your area and creates well-paid jobs.}

Outcome measures included:

{If there was this investment in your area, how/How}...likely would you be to buy an electric vehicle as your next car?

Very likely; Somewhat likely; Not very likely; Not at all likely

{If there was this investment in your area, how/How} much would you support or oppose the federal government's incentives for consumers to buy electric vehicles?

Strongly support; Somewhat support; Somewhat oppose; Strongly oppose

{If there was this investment in your area, how/How} much would you support or oppose a climate policy to move the country away from fossil fuels and toward renewable energy?

Strongly support; Somewhat support; Somewhat oppose; Strongly oppose

{If there was this investment in your area, how/How} likely would you be to vote for a politician who supported the federal government's incentives for consumers to buy electric vehicles?

Very likely; Somewhat likely; Not very likely; Not at all likely

{If there was this investment in your area, how/How} worried would you be about the effects on your area of the federal government cutting its incentives for consumers to buy electric vehicles?

Very worried; Somewhat worried; Not very worried; Not at all worried

6.2.2 Linear Regression Results

We estimate a linear regression of the outcome on a categorical treatment variable, plus controls for age, gender, Black, Hispanic, partisan identification, college education, employment, rural indicator, reversibility concerns, expected benefits/costs from climate policy, income quintile, and a trust index. We detect heterogeneous effects of party identification by college education, which we account for with an interaction term. We randomized the order of some survey blocks, so we include an indicator for if the lock-in experiment came after the delegation experiment.

Table 47: Linear regression of lock-in experiment outcomes

6.2.4 Effects by Partisanship

Figure 3: Heterogeneous Effects of Lock-In Treatment by Partisanship. Thin and thick lines denote 95 and 90 percent confidence intervals.

6.3 Shallow Promises or Deep Laws

Table 49 corresponds with Figure 5.5. For model (1), we interact the treatment with indicators for treatment status from earlier experiments, thus, estimating a “long” saturated regression. For this reason, Figure 5.5 presents the average marginal effect, which is easier to interpret, while these coefficients are more difficult to interpret. We display all of the interactions to provide clarity as to the model specification.

6.4 Community Sacrifice for Credible Compensation

Table 50 is the regression that corresponds with Figure 5.6, which presents the average (unadjusted by covariates) estimates. The treatments come from the following vignette.

Think about the main job-provider in the area where you work. Imagine that the federal government is considering a regulation that will cause layoffs in that industry. The regulation is needed to prevent pollution that will harm human health. To protect workers and communities, the federal government will create an assistance program. The assistance program will include free retraining for workers and grants for local economic development. There is {low / high} bipartisan support for the assistance program. The assistance program is {reversible / not reversible} by a future Congress.

Table 50: Linear regression of support for costly regulations on bipartisanship and institutional constraint treatments

The interpretation check question asks:

How likely or unlikely do you think it is that the assistance program would be reversed in the future?

Very likely; Somewhat likely; Somewhat unlikely; Very unlikely

The question also provides a reminder of the treatment conditions.

8 Chapter 7

8.1 Southwest Pennsylvania Youths

Figure 6: Optimal list of preferred occupations by Southwest Pennsylvania area youths. List constructed using the ranking algorithm proposed by Pihur, Datta, and Datta (2007).

8.2 Expected Adjustment Costs

Results in Figure 7 show that most of the national public believes that changing industries would entail a moderate or large adjustment. Breaking the descriptive results down by youth and non-youth, youths are less likely to see industry changes as a large adjustment.

Figure 7: Expected adjustment costs if one were to change careers.

8.2.1 Consequences of Adjustment Costs on Career Choice

We further explore the effect of mobility on individual's relative interest in different industry careers. If one perceives large adjustment costs, this could lead them to prioritize industries seen as more stable and less uncertain. Based on our results from Chapter 4, the healthcare industry is seen as the best paying and most locally beneficial industry, which should correspond with expectations of career stability. By contrast, green jobs like solar, wind, and

energy efficiency, as well as fossil fuel jobs, were viewed with relatively more uncertainty. If anticipated mobility costs influences expectations, then we should expect the least mobile to prefer the most predictable careers.

We estimate the effect of low mobility on within-subject comparisons of interest in industries using multivariate regression with socio-demographic controls. The measure for low mobility takes the value 1 if a respondent thinks that taking a job in a new industry would entail a moderate or large adjustment and 0 if not. The outcome measure takes the difference between a respondent's rating of two industries. We collapse the green and fossil fuel industries into respective indices to reduce measurement error and capture overall perceptions.

Figure 8 presents the regression results. Specifically, the plot shows the coefficient estimates for the low mobility indicator. Positive values indicate that when a respondent has low mobility, she is more likely to be interested in the first industry (e.g., healthcare) than the second industry (e.g., fossil fuels), since the outcome measure takes the difference in ratings of each industry, respectively. Since low mobility is not randomly assigned, we take these results as correlational, not causal.

For the first contrast between healthcare and green industries provides strong evidence that individuals who perceive large adjustment costs to changing careers are more interested in working in healthcare than clean energy jobs. For the second contrast between healthcare and fossil fuel industries, there is suggestive evidence that people with low mobility are more interested in healthcare than fossil fuels. The last contrast compares green and fossil fuel industries. We find a null result: low mobility has no differential effect that is distinguishable from zero. These results illustrate how perceptions of mobility can influence career choice, which could subsequently shape interest in entering workforce programs to train for green jobs. When people perceive themselves as having low mobility, they are more likely to prefer stable and certain careers in industries like healthcare, as opposed to less certain occupations in renewables and fossil fuels. The lack of an effect of low mobility on perceptions of green and fossil energy careers suggests that there is room for clean energy sector jobs to become more attractive to workers, otherwise people with low mobility might be indifferent between training to enter the respective industries.

Figure 8: Effect of low mobility as measured by adjustment costs to switching industries on within-subject comparisons of interest in industries. Outcome measure takes the difference between the respondent's interest in one industry (or index of industries for green and fossil fuels) and another industry. Plot shows the estimate for an indicator for low career mobility from a regression that also includes controls for age, gender, race, party affiliation, education, income, employment, rurality, and youth sampling block. Thin and thick bars denote 95 and 90% confidence intervals.

8.3 The Day After Graduation: Costly Signals Experiment

8.3.1 Survey Instrument

The respondents read the following vignette with the text inside braces randomized.

Consider a 10 year investment by a state government to expand wind and solar energy. As part of this plan, the state government creates a program to train workers for new wind and solar energy jobs.

The training program provides:

- A monthly stipend for the cost of living.
- No interest loans for tuition.
- {If people cannot find wind and solar energy jobs after 5 years because there are not enough available, they do not need to pay back the loan.}

In all, the loans are estimated to be worth {1 / 5} percent of the state budget.

8.3.2 Linear Regression Estimates

We estimate the average treatment effect of the commitment devices on workforce program credibility using a linear regression. The model includes a set of control variables that capture socio-demographic characteristics, political beliefs, and perceptions about green jobs. Controls include gender, race, ethnicity, income, educational attainment, employment status, age, and youth block indicator. We also include an index for views about green jobs constructed by using principal component analysis to reduce the dimensionality of perceptions of the future of solar and wind jobs into a single dimension that explains the most variance of the components (69 percent).⁶ Table 58 presents the results of estimating the effect of the conditional loan treatment on beliefs about the future of green jobs and support for the training program. This table corresponds with Figure 7.3 in the book.

⁶Since there was a programming issue with partisan identification in the youth survey wave, we impute answers for the partisan lean question, which is used in constructing the partisanship variable. The imputation procedure uses extreme answers to the ideology question (e.g., very conservative, very liberal) as a proxy for a subject's partisan leaning (e.g., Republican, Democrat) in the instances where individuals do not identify with a party.

Table 58: Linear regression of costly signal experiment outcomes on the conditional loans treatment

8.3.3 Mediation Analysis

Government Support for Green Jobs Program The mediator for the first analysis comes from the following question, which measures the effect of the treatment on perceptions of the government’s credibility.

How supportive do you think a future government would be of the **program to train workers** for new wind and solar energy jobs?

Very supportive; Moderately supportive; Slightly supportive; Not at all supportive

If the conditional loans treatment has the intended hand-tying and costly signaling effect, respondents should believe that a future government would be more likely to support the workforce program, which is what we find.

Figure 9 reports the results from the first mediation analysis using beliefs about the government’s support for the green jobs training program as the mediator. Figure 10 presents the results from a sensitivity analysis of the sequential ignorability assumption upon which the mediation analysis rests.

Figure 9: Analysis of the mediating effect of beliefs about government support for green investment on overall perceptions of local investment efficacy from green jobs. Thin and thick bars denote 95 and 90 percent credible intervals.

Spending Worth It For Credibility The mediator for the second analysis comes from the following question, which measures support for higher spending if it enhances the government’s credibility.

Some people believe it is important to spend more money on job training programs to show that the government is serious about creating new jobs. Others worry that spending more money could be bad for the financial health of the government. Do you think it is...

*Better to not spend more money to protect the government’s financial health;
Better to spend more money to show that the government is serious about jobs*

Figure 11 presents the results, which show that the conditional loans treatment increases willingness to spend money to create credibility, which in turn creates greater expectations

$$\text{ACME}(R_M^{2*}, R_Y^{2*}), \text{sgn}(\lambda_2\lambda_3) = 1$$

Figure 10: Sensitivity analysis for the sequential ignorability assumption for the mediation analysis with beliefs about government support for the green training program as the mediator. There would have to be an extreme confounder that jointly explains 30 percent of the variance of the outcome and mediator, and is orthogonal to the other covariates in the model, for the ACME to go to zero.

of local benefits from green jobs. Figure 12 presents the results from a sensitivity analysis of the sequential ignorability assumption.

Figure 11: Analysis of the mediating effect of support for spending money to generate credibility on overall perceptions of local investment efficacy from green jobs. Thin and thick bars denote 95 and 90 percent credible intervals.

Figure 12: Sensitivity analysis for the sequential ignorability assumption for the mediation analysis with support for spending to generate credibility. There would have to be an extreme confounder that jointly explains 20 percent of the variance of the outcome and mediator, and is orthogonal to the other covariates in the model, for the ACME to go to zero.

8.3.4 Follow-On Budget Experiment

We conducted a follow-on experiment to analyze our interpretation of the baseline budget condition. The rationale is that respondents are sensitive to the high budget condition, thinking that it might enhance the likelihood of reversal. To validate our interpretation, our follow-on experiment presented the respondent with this vignette:

If a government program accounted for a {large/small} share of the overall budget, over the next 10 years do you think funding for the program is likely to be:

reduced, increased, unchanged

We analyze an indicator for if the respondent thinks the investment is likely to be reduced or not. Table 59 presents the results, which show that when the investment occupies a smaller share of the budget, the public expects that the investment is less likely to be reduced in the future.

Table 59: Linear regression of beliefs about investment reversal on an indicator for if the investment takes a small share of the budget

9 Chapter 8

9.1 Union and National Survey

The main question of interest on the survey assessed whether these predominately fossil fuel workers would support wind energy if the new jobs were local.

Which statement best describes your position on wind energy?⁷

We should stop new wind farm construction to try to protect coal jobs; We should allow new wind farms if the jobs go to local workers; We should allow new wind farms no matter who gets the jobs; Other

The possible responses include the position that wind farms should be stopped to protect fossil fuel jobs, which is a belief we uncovered using our highly targeted surveys of fossil fuel communities. This zero-sum perspective has consequences for policy. Several counties in North Dakota, such as McLean and Mercer, have passed moratoria against building new wind energy developments because of the concern that renewable energy will push out fossil fuels.⁸

In the national sample, we also evaluated responses to this question, but with solar instead of wind, while randomizing the order of the questions to avoid bias. Figure 13 shows that the answers are comparable.

Figure 13: National views about wind and solar job creation depending on the local benefits. Survey weights employed. National survey from CAPS/Harris in August 2022. $N = 1,002$.

⁷The question ended with “in [redacted state name], which we omit for confidentiality.”

⁸See Stokes (2016) for a study of electoral backlash to wind permitting.

11 Chapter 9

11.1 Government Commitment to Climate Finance

Figure 14: National public perceptions of the government’s commitment to climate finance for developing countries. The question asked, “If the US Federal government commits to sending resources to developing countries to help combat climate change, how likely is it that they will fulfill this commitment?” Sample of the national public with Qualtrics ($N = 2019$).
